

ChatGPT + Adobe Plugin

Introduction

A dedicated ChatGPT plugin for Photoshop is not currently available, so this test explores how ChatGPT can support a Photoshop-based workflow through image editing and PSD-style output.

The goal is to see whether ChatGPT can help designers create, refine, and modify visuals faster, reduce repetitive manual work, and prepare editable assets that can continue to be refined in Photoshop.

Test case

- Generate and refine the visual in ChatGPT
- Use the Adobe integration for PSD preparation
- Separate key visual elements into editable layers
- Continue refinement in Photoshop
- Measure time saved compared with the normal workflow.

Input

Output

16 TURBINENBLÄTTER

Widerstand steigt mit deinem Zug —
ganz ohne Stufen

- 10 Liter Wassertank
- 16 Turbinenblätter
- Realistisches Wassergefühl

PSD Format

Output

PSD Format

Pros

- Generate the visual directly in ChatGPT and continue editing it in Photoshop.
- Useful for separating key elements, removing text, and refining individual parts of the visual.
- The biggest advantage is that we can get both the final image output and an editable PSD file.
- This reduces the need to rebuild the full visual manually in Photoshop.

Cons

- The PSD output is not always consistent.
- In some tests, after requesting an editable PSD, the file contained only a single flattened image instead of properly separated editable layers.
- Because of this, the PSD needs to be checked before it can be used for production.

Conclusion

- The ChatGPT + Adobe workflow can support designers by reducing repetitive manual work and speeding up the process from image generation to Photoshop refinement.
- A key advantage is the ability to generate a visual in ChatGPT and continue working on it in Photoshop with editable elements and PSD output, which can save time compared with rebuilding the design manually.
- The workflow is especially useful for first-pass creation, element separation, text removal, background adjustments, and quick refinements.
- However, PSD output is not always consistent, so designer review is still required to check layer structure, product accuracy, and final quality before production use.
