QWEN AI IMAGE MODEL

TEST & ANALYSIS

INTRODUCTION

Qwen-Image-3.0 is the third-generation image generation model from Alibaba's Qwen team. The model is designed around three main improvements: rich content, authentic details, and deep knowledge. It supports prompts of up to 4.5K tokens, complex layouts such as infographics, storyboards, newspapers, and UI designs, text rendering as small as 10 pixels, and native support for 12 languages and more than 100 visual styles. In this review, we tested how well these new capabilities perform in our practical creative workflow, focusing on generation speed, character realism, product accuracy, machine details, character placement, output consistency, and the amount of rework required for final production.

IMAGE GENERATION WITH REFERENCE IMAGES

INPUT

Replace the background with a bright modern Scandinavian home interior in daylight. Keep the rowing machine, person, pose, product details, and camera angle exactly the same. Add a minimalist living room setup with light oak flooring, soft beige walls, large windows, natural daylight, curtains, a sofa, and indoor plants. Create a premium realistic lifestyle fitness atmosphere with soft shadows and natural lighting. Avoid harsh sunlight or changing the product.

CHATGPT

QWEN - 3.0

INPUT

The character's arms should be straight at the end. Make sure not to change the product and character holding the tris-up cable.

CHATGPT

QWEN – 3.0

INPUT

Prompt style description: Modern Scandinavian minimalist living room interior, warm beige walls, light oak wooden flooring, large windows with soft natural daylight, sheer curtains, neutral fabric rug, dark leather sofa, wooden sideboard, indoor plants, clean premium European apartment aesthetic, cozy wellness lifestyle atmosphere, realistic shadows, soft warm tones.

CHATGPT

Translate text from
french to english

INPUT

CHATGPT

QWEN – 3.0

I want the character to run while looking at the tablet. Do not make any other changes.

INPUT

change the white studio
background into the
lifestyle image backgrounds

CHATGPT

QWEN - 3.0

TEXT TO IMAGE GENERATION RESULTS

TESTING OBSERVATION

We tested the Qwen-Image-3.0 model for both image editing and text-to-image generation. The text-to-image results were promising, with detailed visuals, improved character realism, and better overall image quality.

However, the generated visuals are not yet ready for direct production use. We still need to rework the images and replace or correct the product using tools such as ChatGPT or Nano Banana. This adds an extra step to the workflow and may increase the overall production time.

Overall, the test results are encouraging, especially for concept development and early visual exploration. With further refinement and better product consistency, the model could become more useful for our creative workflow.

CONCLUSION

Qwen AI Image Model is useful for basic concept exploration, but it currently performs below our existing workflow in overall quality and consistency. The model needs improvement in character face details, skin texture, anatomy, product accuracy, machine details, and character placement. Most outputs still require manual correction before they can be used as final product visuals.

THANK YOU
